01 EXECUTIVE SUMMARY

Headline numbers and the story behind them

Observation window 2016-01-01 to 2016-04-01 · 11,295 sessions across 21 channels and 9 provinces

11,295	5,375	87,207	8.7 min
SESSIONS	VIEWERS	TOTAL MINUTES	AVG / SESSION

BRIGHT TV recorded **11,295 viewing sessions** from **5,375 unique viewers** over the three-month window, generating **87,207 minutes** of total watch-time. The audience skews strongly male (87.8%) and Youth-led, with **Gauteng** the dominant market. The **17 hour (17:00)** stands out as the daily prime-time peak, while **ICC Cricket World Cup 2011** programming captures the largest share of total minutes consumed.

01 AUDIENCE

Youth (18–35) drive 55% of all sessions. Male viewers account for 87.8% of activity — a clear skew that should shape creative and sponsorship decisions.

02 CONTENT

ICC Cricket World Cup 2011 alone accounts for 24,083 minutes — roughly 27.6% of total watch-time. Sport remains the biggest single driver of engagement.

03 TIMING

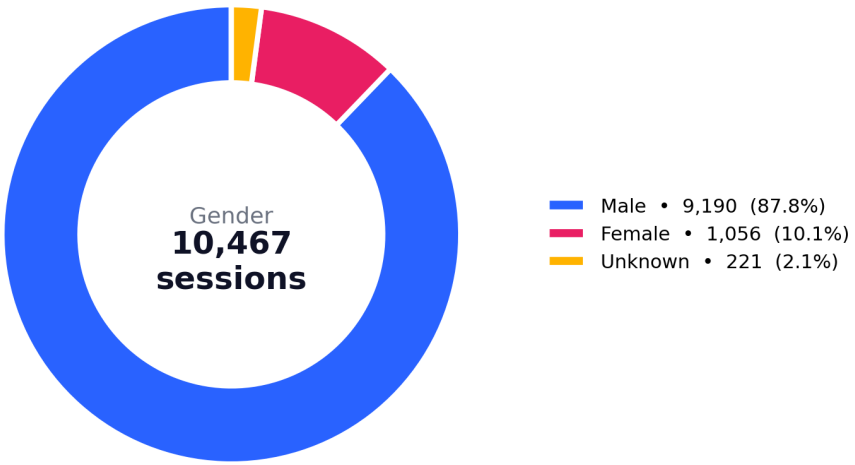
The 17:00 hour is the single largest demand window. Afternoon and Night slots together capture the majority of viewing — ideal for stacking premium ad inventory.

02 DEMOGRAPHICS

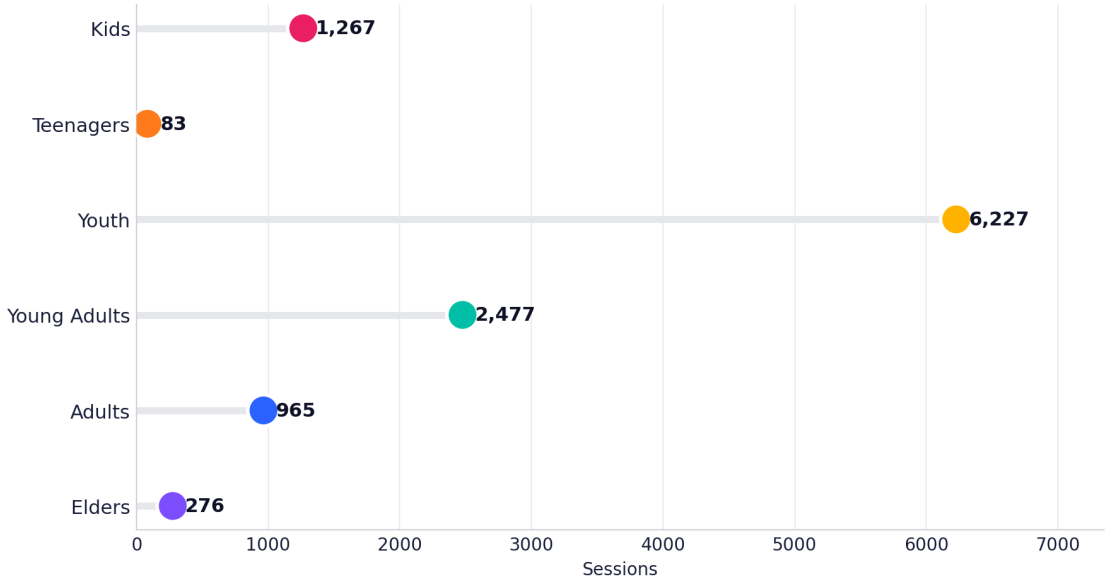
Who is watching BRIGHT TV?

Composition of the audience by gender and age group

Gender Distribution



Age Group Composition



INSIGHT

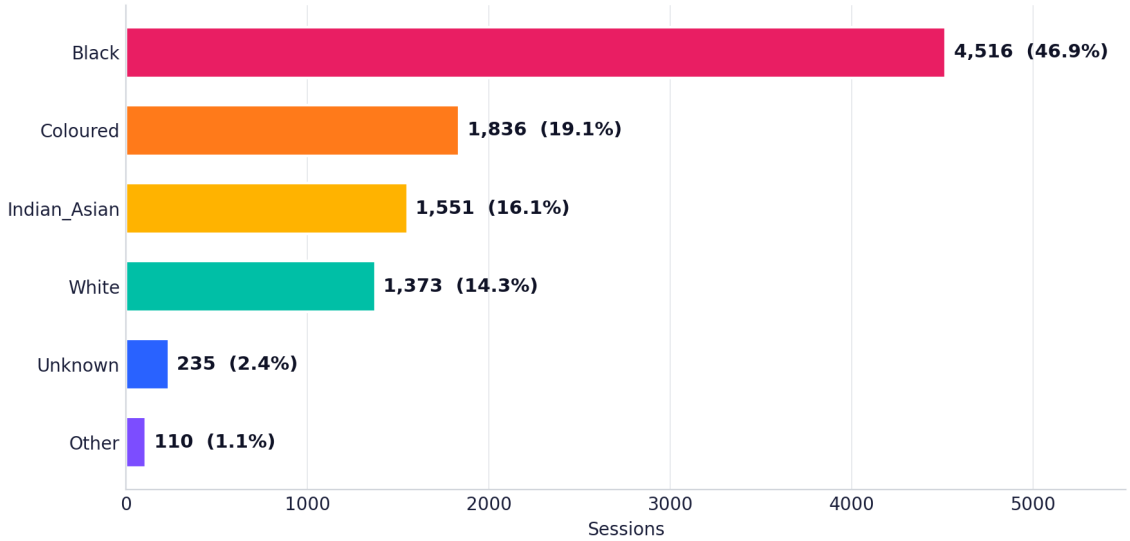
The audience is overwhelmingly male and Youth-led. Combined, Youth and Adults represent the vast majority of sessions, while Children and Elders form niche but distinct sub-segments with different content and timing preferences.

02 DEMOGRAPHICS

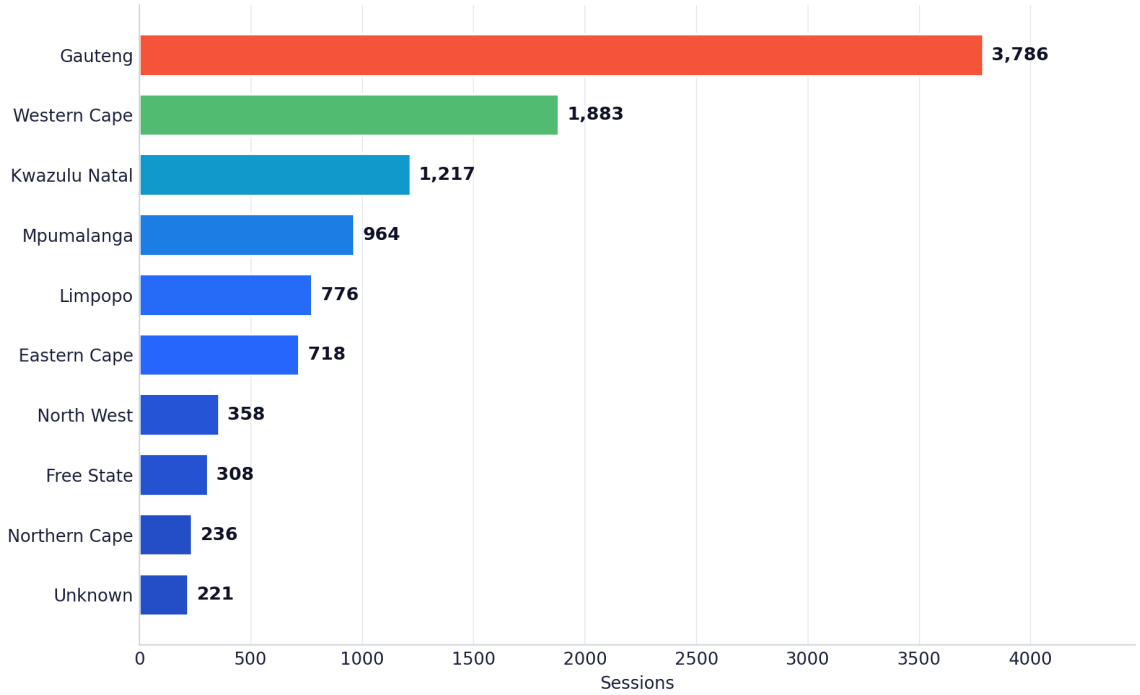
Race and provincial footprint

Where the audience lives and how it self-identifies

Audience by Race



Provincial Viewership Volume



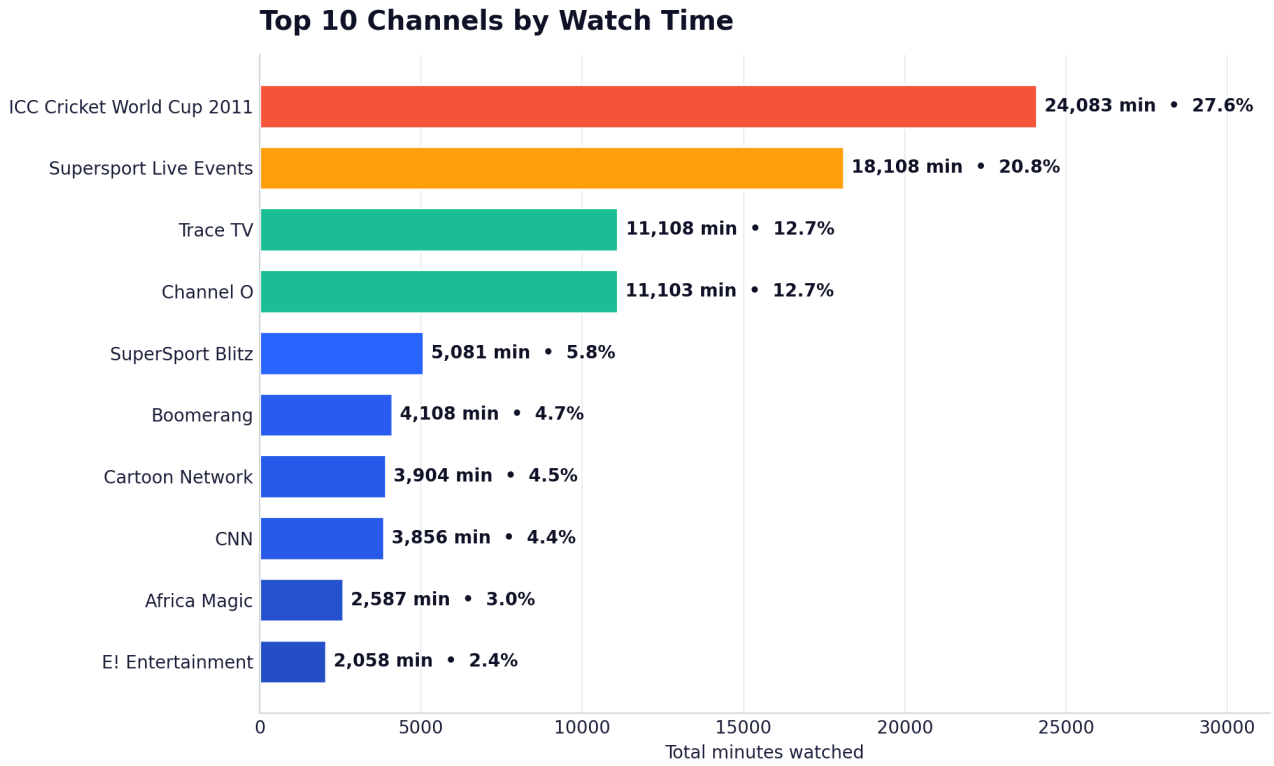
GEOGRAPHIC CONCENTRATION

Gauteng alone delivers 3,786 sessions — the single largest provincial market. Together with Western Cape and KwaZulu-Natal it forms the core commercial belt and the obvious priority for distribution and sales effort.

03 CHANNEL PERFORMANCE

Where attention is spent

Top 10 channels ranked by total minutes watched



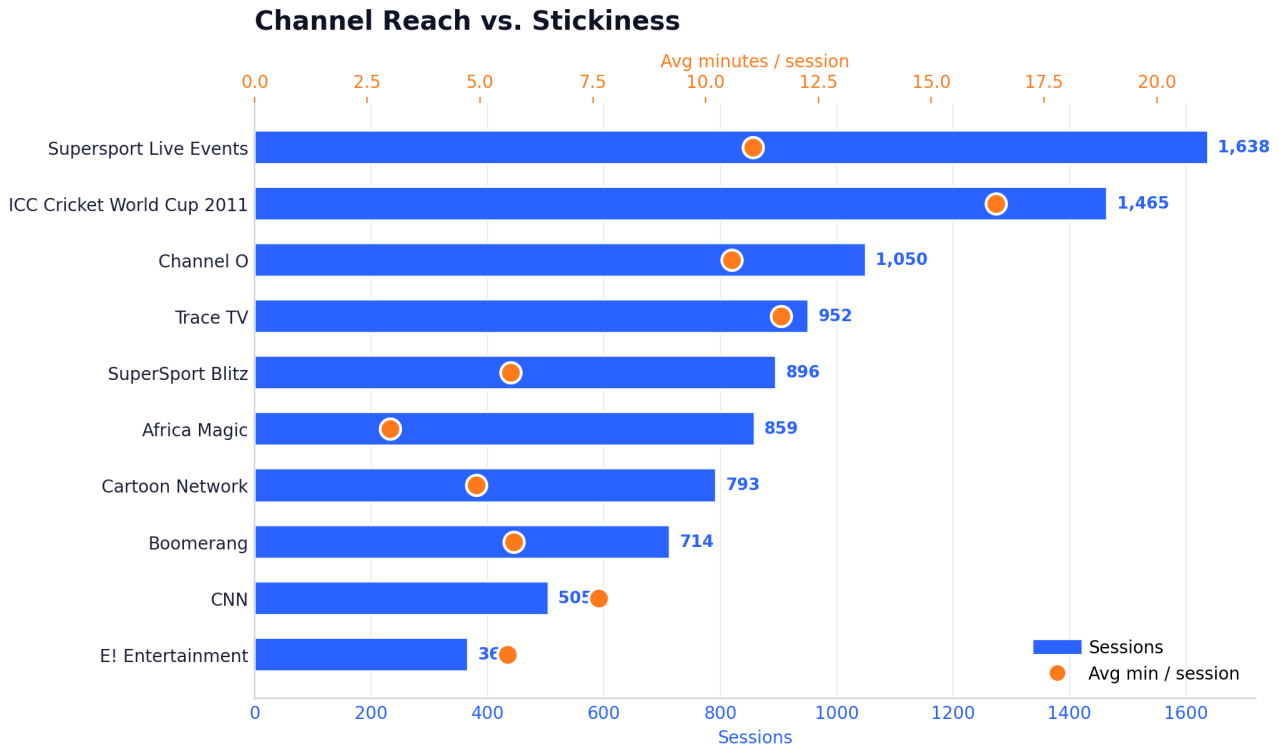
CONTENT KING

ICC Cricket World Cup 2011 dominates with 24,083 minutes — about 27.6% of total watch-time. Sport drives the longest sit-and-watch sessions and anchors the prime-time window.

03 CHANNEL PERFORMANCE

Reach vs. stickiness

Sessions (volume) compared with average minutes per session (depth)



READ THE CHART

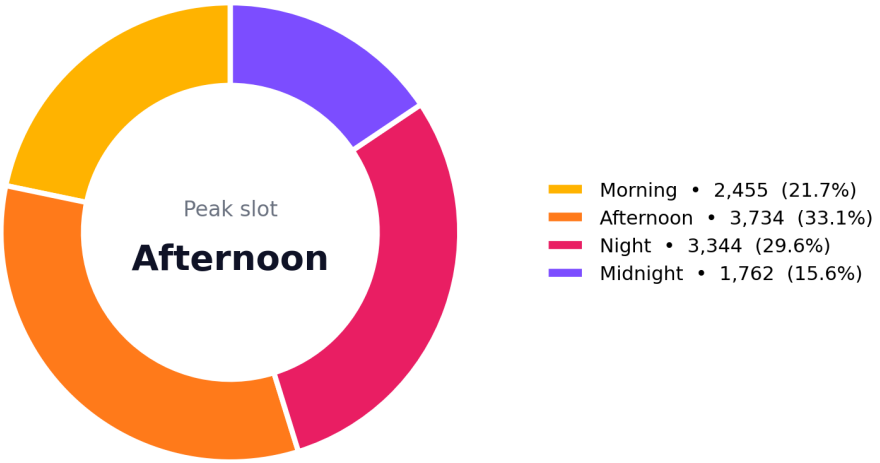
Bars show how many sessions a channel attracts; orange dots show how long viewers stay. Channels with both high reach and high stickiness are the most valuable advertising surfaces.

04 WHEN PEOPLE WATCH

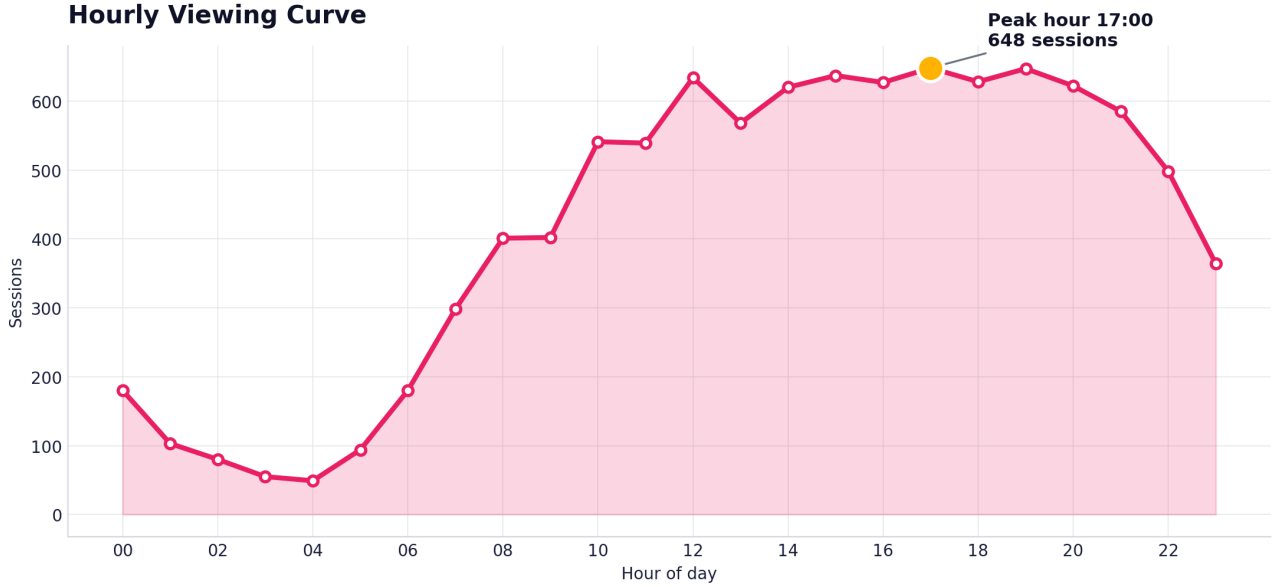
The shape of the viewing day

Demand by time-slot and the hour-by-hour curve

Viewing by Time-of-Day Slot



Hourly Viewing Curve



PRIME-TIME WINDOW

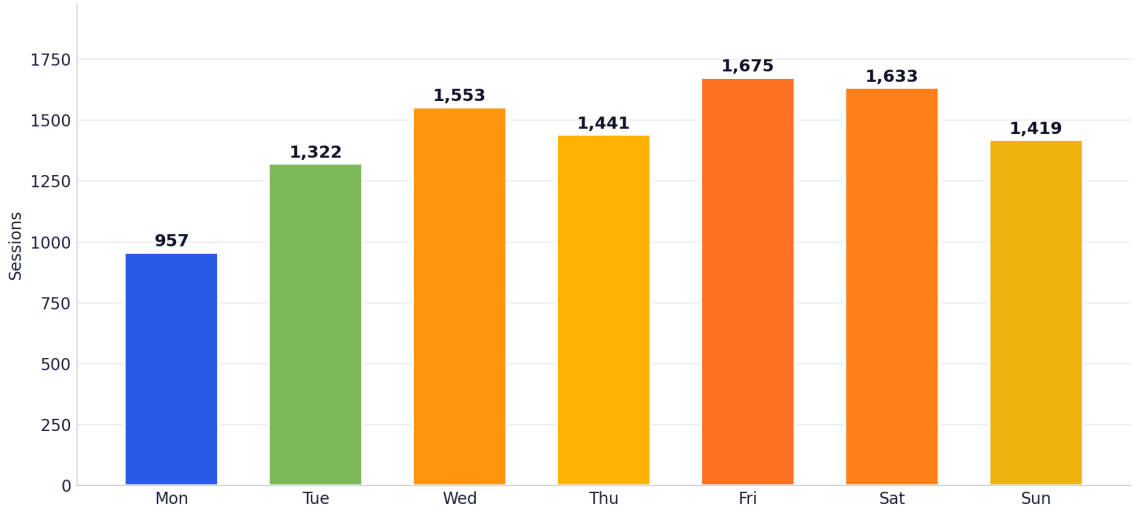
The 17:00 hour is the single busiest slot. Afternoon and Night together carry the bulk of demand — these are the windows where premium inventory should be priced highest.

04 WHEN PEOPLE WATCH

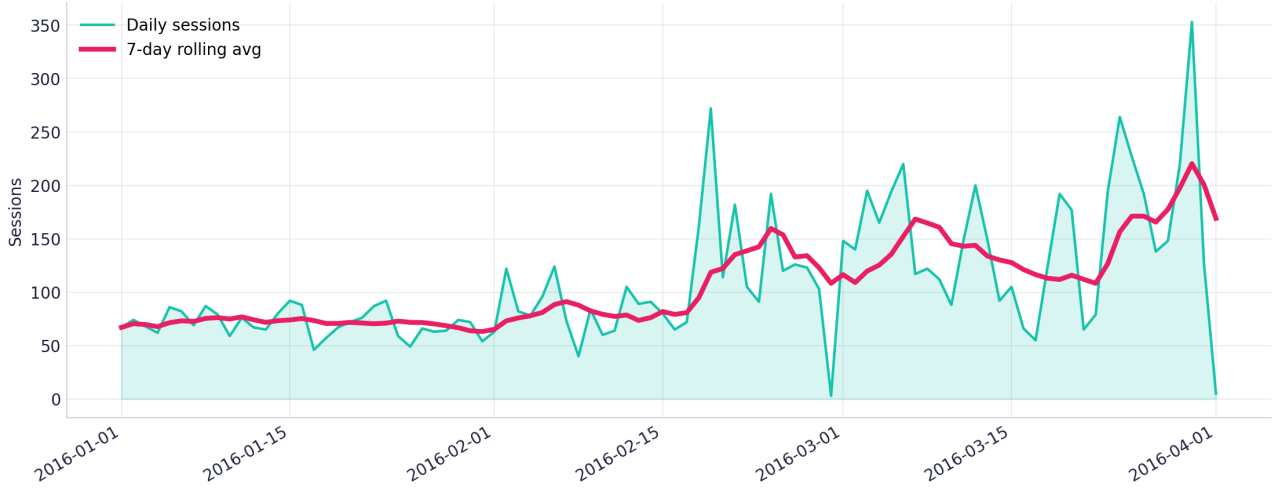
Weekday rhythm and trajectory

Day-of-week distribution and daily volume across the period

Viewing by Day of Week



Daily Sessions with 7-Day Rolling Average



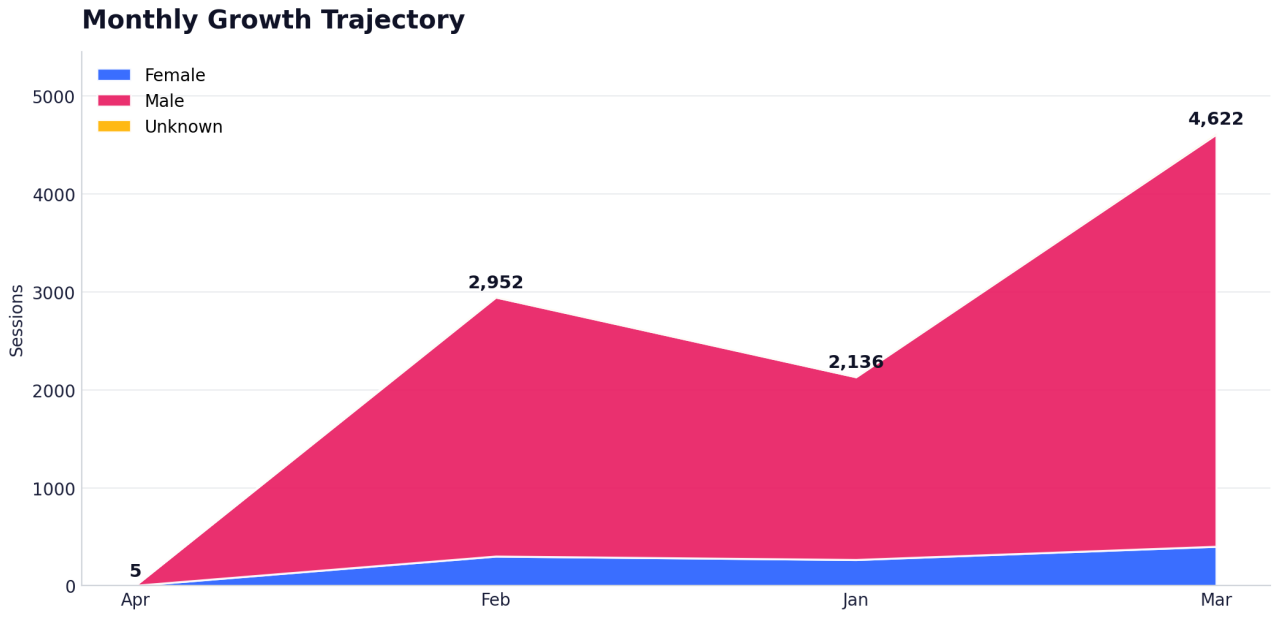
MOMENTUM

Fri is the strongest day of the week. The 7-day rolling average reveals a clear upward trajectory across the observation window — viewership is growing, not just fluctuating.

05 GROWTH & TRENDS

Monthly growth, segmented by gender

Stacked sessions show both total growth and the consistent gender mix



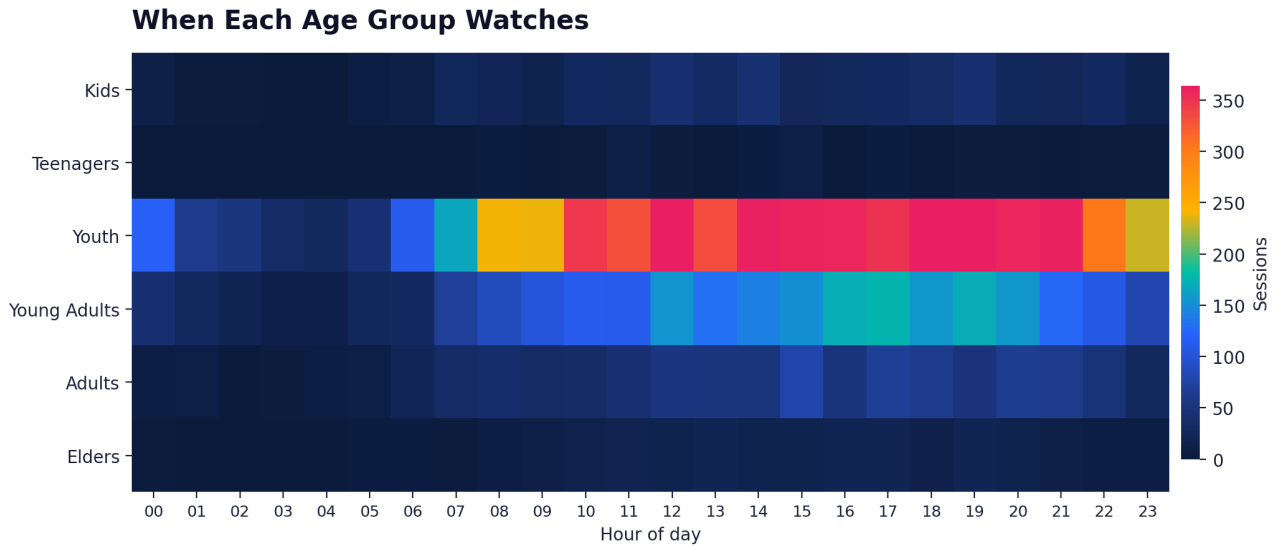
TRAJECTORY

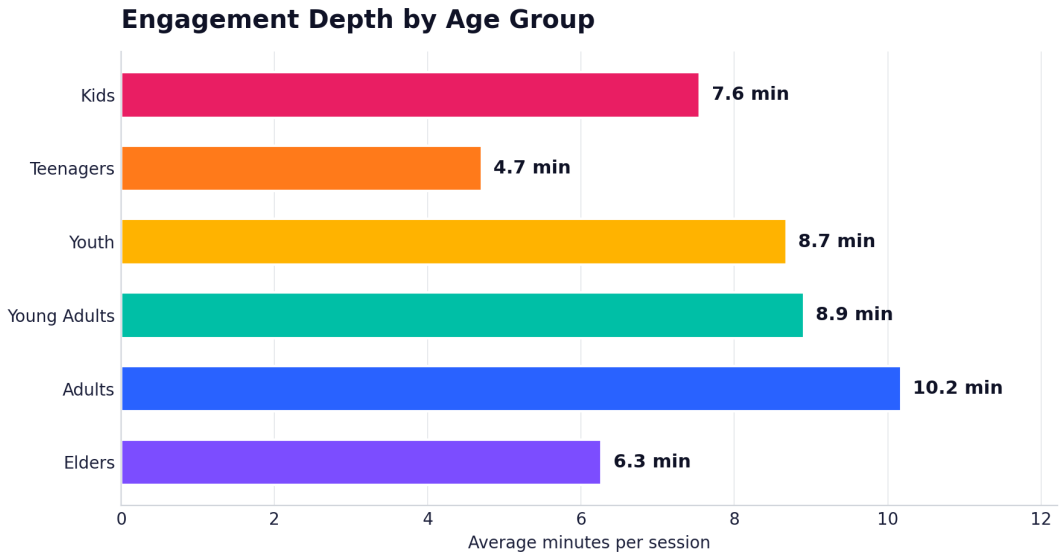
Sessions grew strongly from January through March — roughly doubling over the period. The gender mix remained stable, suggesting growth is driven by reach (more viewers of the same profile) rather than a shift in audience composition.

06 CROSS-SEGMENT PATTERNS

When each age group watches

Heat-map intensity reveals the time-window owned by each cohort





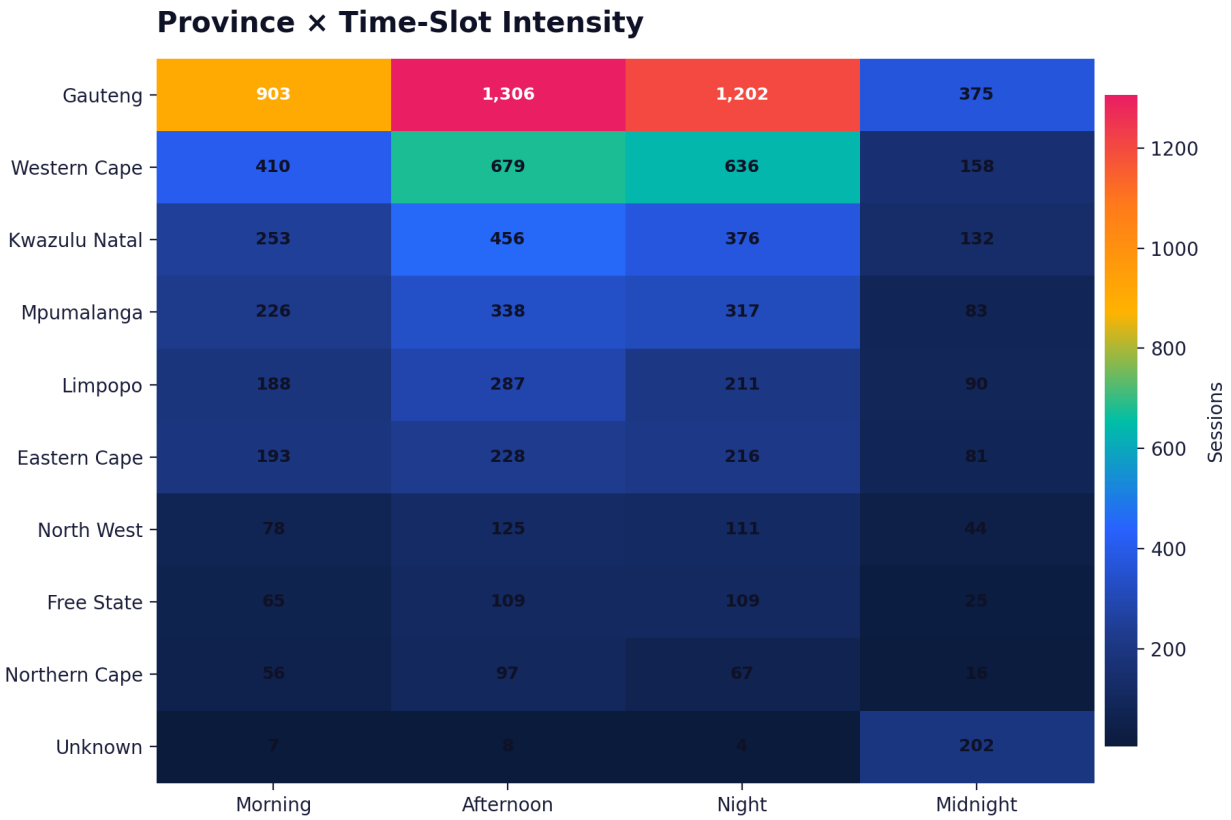
ENGAGEMENT DEPTH

Adults watch the longest sessions on average (~10 minutes), making them the most engaged cohort per impression. Youth dominate sheer volume but in shorter bursts concentrated around the prime-time peak, while Teenagers and Elders are smaller, more occasional audiences.

06 CROSS-SEGMENT PATTERNS

Province × time-slot intensity

Where and when audiences actually watch — labelled session counts



READ THE MAP

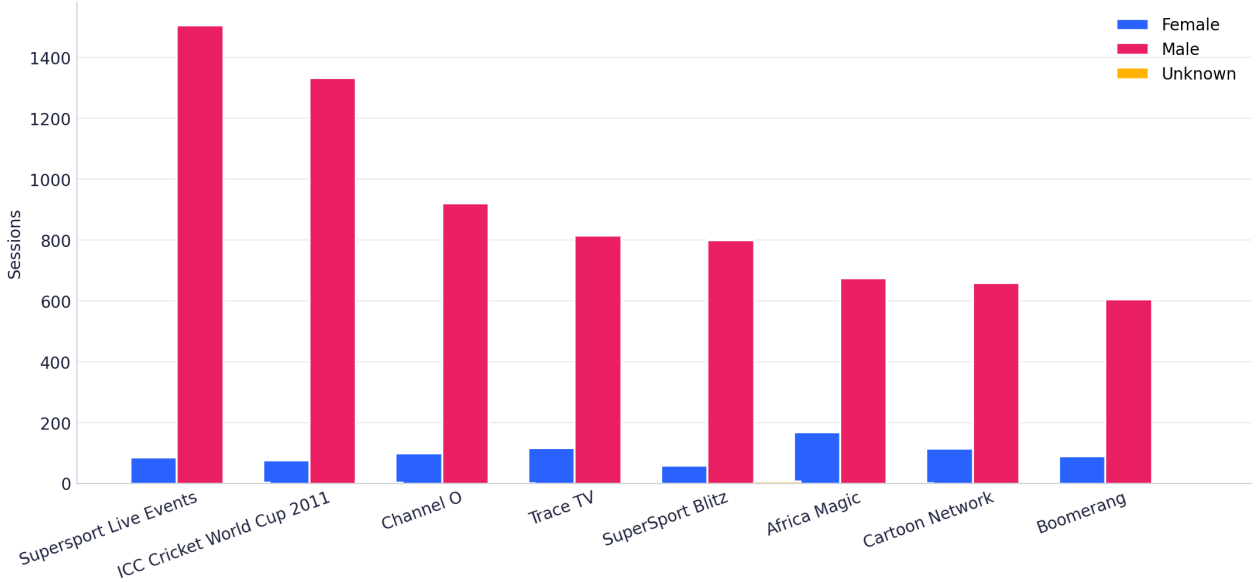
Each cell is the number of sessions for a given province in a given slot. Gauteng's Afternoon and Night cells are the brightest — these are the highest-value impressions in the dataset.

07 CHANNEL × AUDIENCE MIX

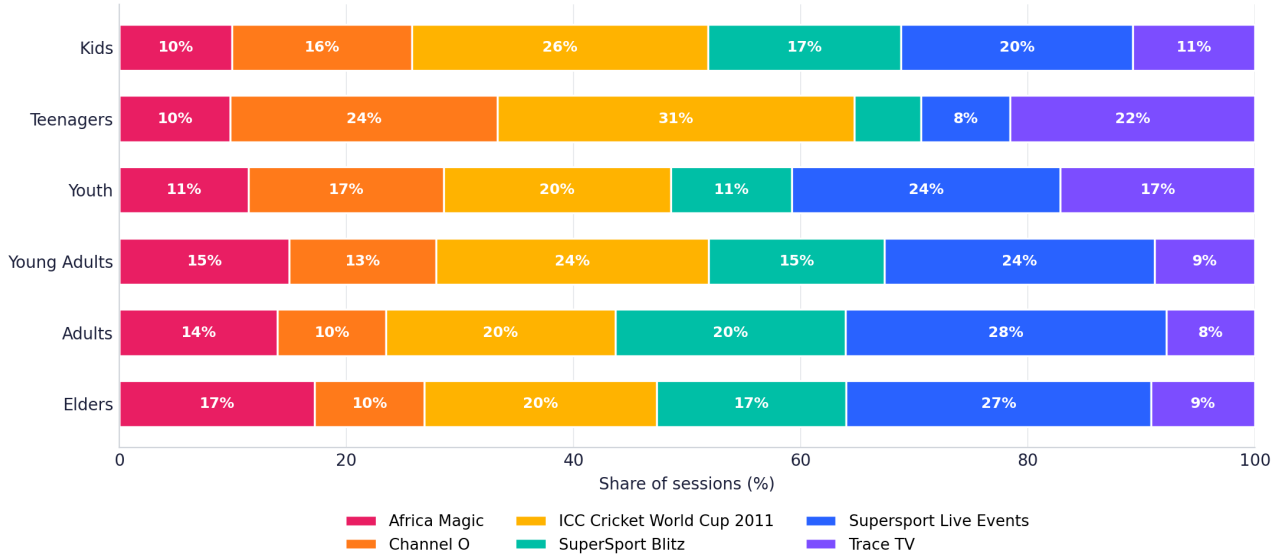
How each channel splits its audience

Top channels by gender, and the channel-mix that defines each age group

Top Channels by Gender



Channel Mix by Age Group



PROGRAMMING SIGNAL

The age × channel mix exposes which titles index disproportionately to specific cohorts. Use this view to align ad packages, sponsor categories and on-air promos to the cohort that actually shows up for each show.

08 STRATEGIC RECOMMENDATIONS

From insight to action

Five concrete moves grounded in the data

01 PROTECT THE PRIME-TIME PEAK

Treat the 17:00 hour as a strategic asset. Stack premium content and highest-yield inventory in the Afternoon→Night corridor where the audience is already present.

02 DOUBLE DOWN ON SPORT

ICC Cricket World Cup 2011 alone delivers ~28% of total minutes. Secure long-form sport rights and build wraparound shoulder programming to extend the halo.

03 WIN GAUTENG FIRST

Gauteng contributes 3,786 sessions — the largest single market. Concentrate distribution, sales and on-the-ground research effort here before scaling out.

04 BUILD FOR YOUTH, MONETISE ELDERS

Youth drive volume; Elders drive depth (longest sessions). Run parallel content tracks: short-form hooks for Youth and longer-form, ad-friendly programming for Elders.

05 CLOSE THE GENDER GAP DELIBERATELY

With only 10.1% female participation, there is a clear opportunity to grow the audience by commissioning content tested explicitly with female focus groups.

Methodology

All figures are computed directly from the supplied BRIGHT TV dataset covering 2016-01-01 to 2016-04-01. Sessions are deduplicated by user-channel-time. Time-slots follow South African convention (Morning 05–12, Afternoon 12–17, Evening 17–21, Night 21–05). No data has been imputed — only fields present in the source were used.
